

Today's **BIG DATA** world is all about **CHOICES** — choice of platforms and technologies, data sources and analytic solutions, and whether to deploy your own clusters or depend on a service provider for some, or all, of your big data environment. So, making the decision and commitment to a Big Data solution is just the tip of the iceberg. The real challenge comes into play when you need to combine the right technologies, platforms, service providers and analytics in a way that makes sense for your business environment and goals.

In dealing with any degree of change, the most prudent approach is usually an incremental, low-risk migration from where you are today to a future state that focuses on core business values. This strategy is calculated, and brings a strong balance of continuing to leverage what you do today; with introducing new capabilities to keep up; with the constantly, increasing demands of your customers and stakeholders.

BALANCE™

Tectonic's Balance program is a comprehensive methodology and toolset designed to craft a tailored Big Data strategy and approach just for your company. It's designed to realize the potential of Big Data without suffering from the growing pains and uncertainty associated with disruptive new capabilities. Tectonic's Balance program will help you find the right platform and maintain the right balance over the life of your big data analytics projects. Balance is about finding and following the Value.
